

Economics

Q1 · Can rewards change app strategies?

		App B	
		C	D
App A	C	3+r, 3+r	1+r, 4
	D	4, 1+r	2, 2

C = healthy; D = addictive policy

Payoffs: (A, B); reward r for each C

$r < 1$: DD $r > 1$: CC

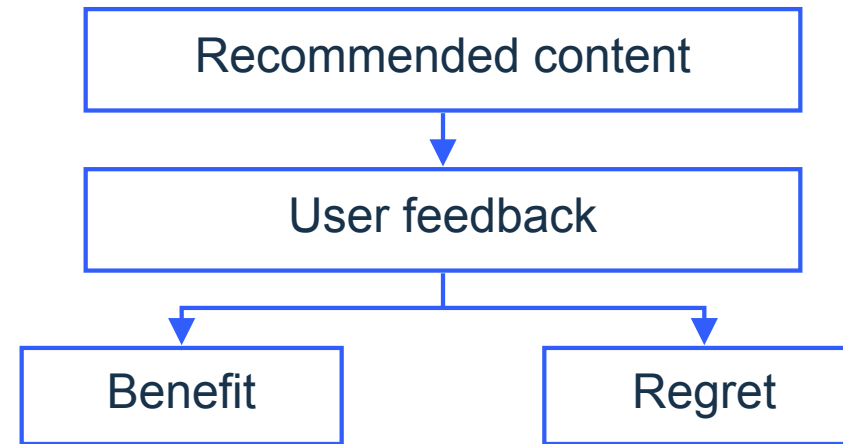

$r = 1$: all strategy pairs are equilibria

Prediction under the assumed payoffs

Computer science

Q2 · What counts as healthy?

More benefit reports than regret?

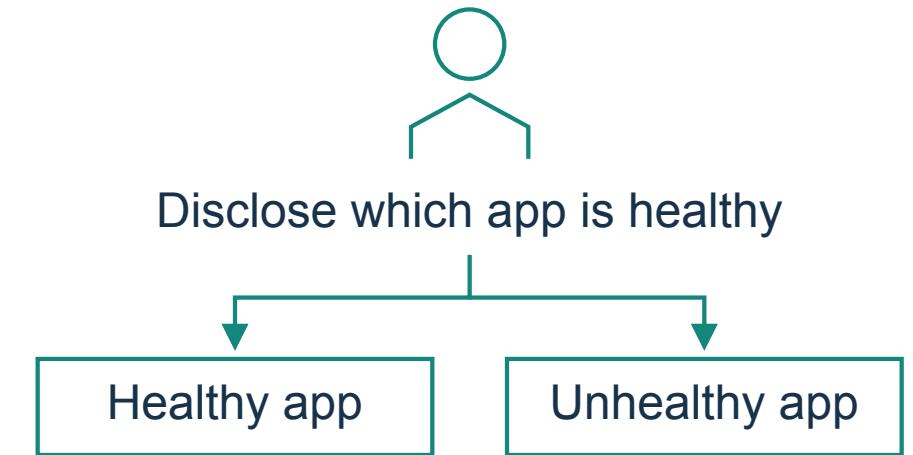

Yes: healthy label; otherwise: unhealthy

Preliminary proxy; separate from time

Behavioral science

Q3 · Will users choose healthier apps?

Record choice + reported reason

Health information vs. content appeal

Self-reports alone cannot establish why

Planned test: align platform incentives with user-valued recommendations

Define the label (Q2) → vary the reward (Q1) → test informed user choice (Q3)
